

Your collection. In focus.

Sign in, set up your folders, and get ready to install.

01 / SIGN IN

01 Sign in

Use your Auralis email and password, or choose **Continue with Apple** and finish in your browser. Apple sign-in expires after three minutes.

02 Complete first-time setup

Add an optional nickname. Review your AU/VST3 folders and installation location, then choose **Confirm & Finish Setup**.

03 Open Software

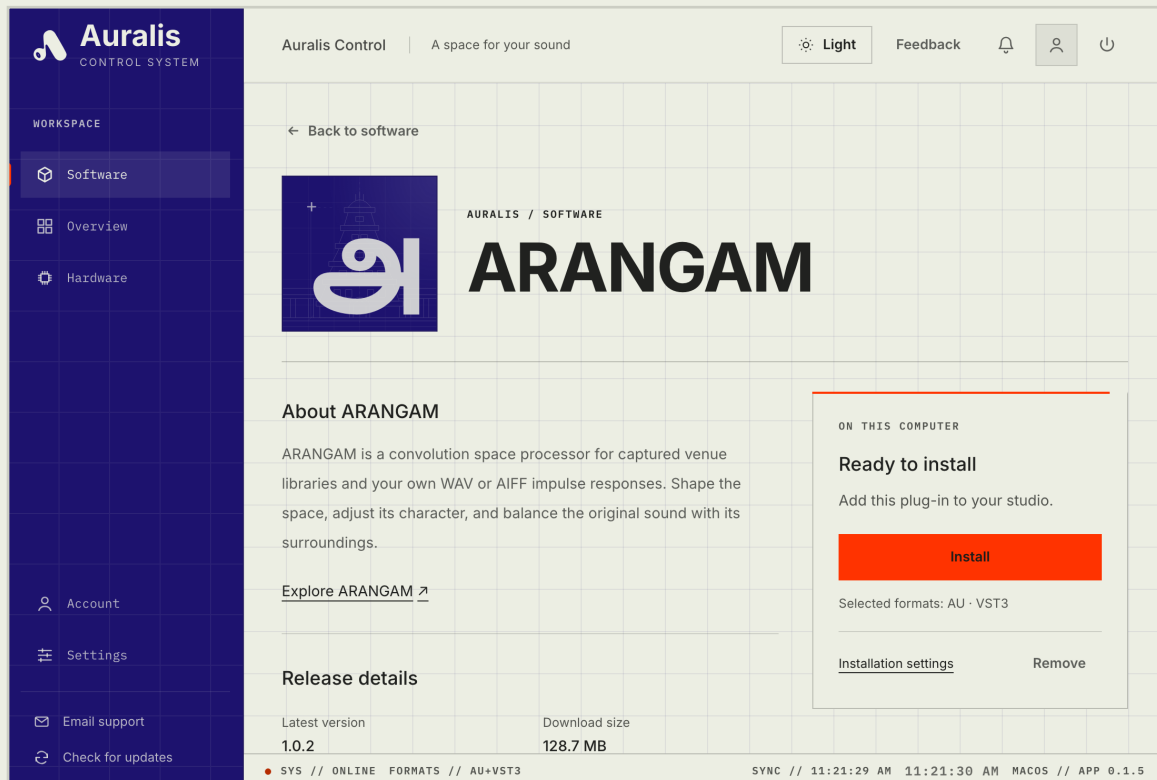

Choose **Refresh library** to load products available to your account. Use **All, Installed, Updates** or search to find a product.

Need an account or help signing in? Choose **Email support** or contact dev@auralis-audio.com. Google sign-in is no longer available.

Install. Then make sound.

Save your DAW session before changing plug-ins.

02 / PRODUCT DETAILS

01 Choose your product

Open its card in Software. Check **Release details** for compatibility. If offered, choose **Claim free** to add it to your account first.

02 Install and allow completion

Choose **Install**. Save and close your DAW when prompted, and approve macOS administrator permission if requested. Keep ACS open until it reports **Installed**.

03 Reopen your DAW

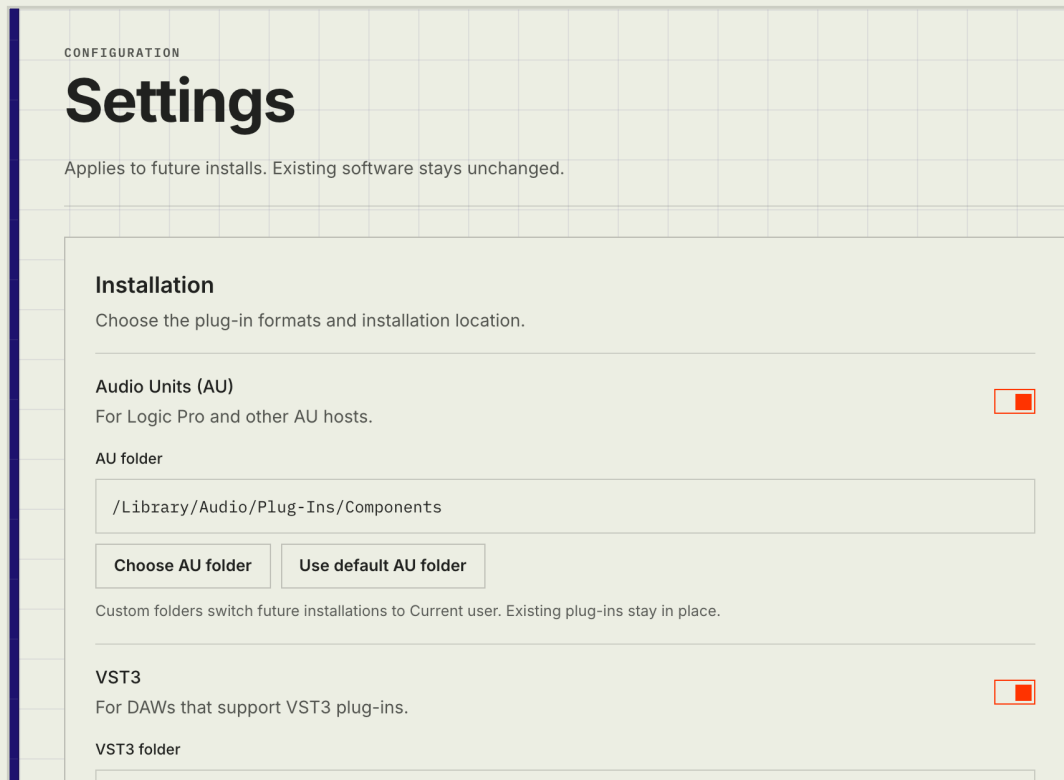

Let its plug-in scan finish, then load the product. ARANGAM's required default libraries are included in its installation.

To update a plug-in: **Refresh library > Updates > product > Update**. Use **Reinstall** from product details to replace an installed copy. Only one installation runs at a time.

Set it up for your studio.

Settings affect future installs. Choose Save changes when done.

03 / SETTINGS - INSTALLATION

01 Enable the formats your DAW uses

Choose **Audio Units (AU)** for Logic Pro and other AU hosts, or **VST3** for VST3-compatible DAWs. Keep at least one supported format enabled.

02 Choose the installation location

All users uses the startup disk's Library and requires administrator permission. **Current user** uses your home Library. Custom folders must be scanned by your DAW.

03 Match the Mac and host architecture

Leave **Plug-in architecture** on **Auto** unless your host needs a specific build. Intel plug-ins on Apple Silicon need a DAW running under Rosetta.

Changing a folder or architecture does not move or replace existing plug-ins. **Save changes**, refresh successfully, then reinstall or update explicitly.

Keep your session moving.

Repair, update, or get help without hunting through menus.

Personalization

Nickname

Used to greet you in ACS on this computer. Leave blank for a general welcome.

Maintenance & support

Quick tour
A short introduction to the dashboard, software, settings, and your account. [Take a Tour](#)

Download cache
Free up downloaded files. Installed software and licenses stay intact. [Clear cache](#)

Diagnostics
Export a sanitized report to help troubleshoot a problem. [Export diagnostics](#)
Tokens and personal identifiers are excluded.

Feedback
Report a bug or suggest an improvement. Also available from the top bar. [Send feedback](#)

04 / SETTINGS - MAINTENANCE & SUPPORT

01 Missing product or plug-in?

Clear search, select **All**, then **Refresh library**. For a plug-in missing in your DAW, check format, architecture and scan folders; restart or rescan the host. Reinstall if needed.

02 Maintain or remove

Use sidebar **Check for updates** for ACS app updates. In product details, **Remove** opens removal choices. ARANGAM's **Plug-in only** keeps included IRs; **Remove fully** deletes them. Imported libraries and presets are kept.

03 Send useful diagnostics

In **Settings > Maintenance & support**, choose **Export diagnostics**. Attach the saved report to an email to **dev@auralis-audio.com**, with the error, product, DAW and macOS versions.

Clear cache removes downloads, keeping installed software. **Account > Sign out** keeps plug-ins installed. Screenshots show the current interface with sample data; account availability varies.
